So {*d1(S1 delta1)*} is maximal.

	<i>d1(S1 D1)</i>	<i>d2</i>

So $\{d_1(S_1 \delta_1)\}$ is maximal.

Extra Question

d_2 becomes uniquely maximal if it is assigned a value strictly larger than 2.7.

So all three remaining normal form decisions { $s1,d1,d2$ } are maximal.

Value of Information

A simple check reveals that $s1$ is no longer optimal as soon as c exceeds 1.58 (this would increase the lower prevision of $d1 - s1$ by 0.58, which is just enough to make it zero).
